Pivot
WiFi Requirements for IP cameras

- Your network SSID or network name can NOT be hidden.
- The WiFi password MUST be WPA or WPA2.

  (WEP is not secure and will not be recognized)

- Passwords and SSID names must be a minimum of 6 alpha-numeric characters. Special characters or spaces will not be recognized.
- WiFi networks with no password (open network) are not considered secure. Some Zmodo cameras will no longer accept this setup. If you try to connect your camera to an open network, and the camera will not connect, you will need to add a password to the network in order to proceed with the camera setup.
